

Fresh-seed evaluation: consumption, stock and local access

Four paired seeds 63001-63004 · nine grid cells plus all five sensitivities · six declared conditions

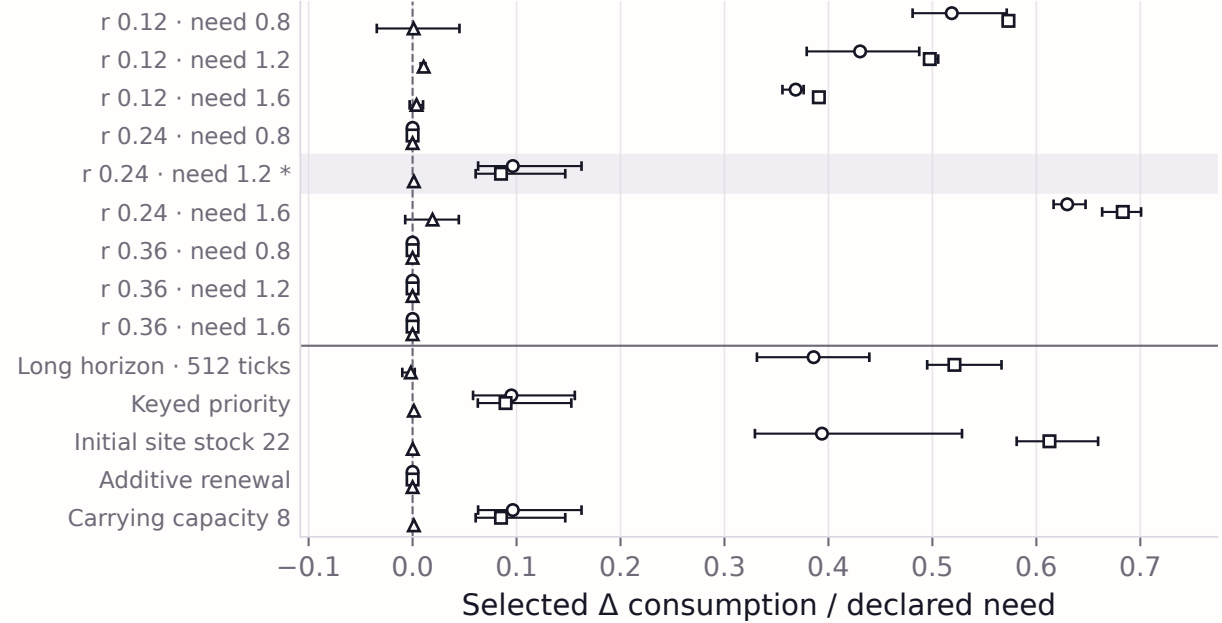

A Population consumption in all 14 cells

Four baseline populations; symbols are vertically offset

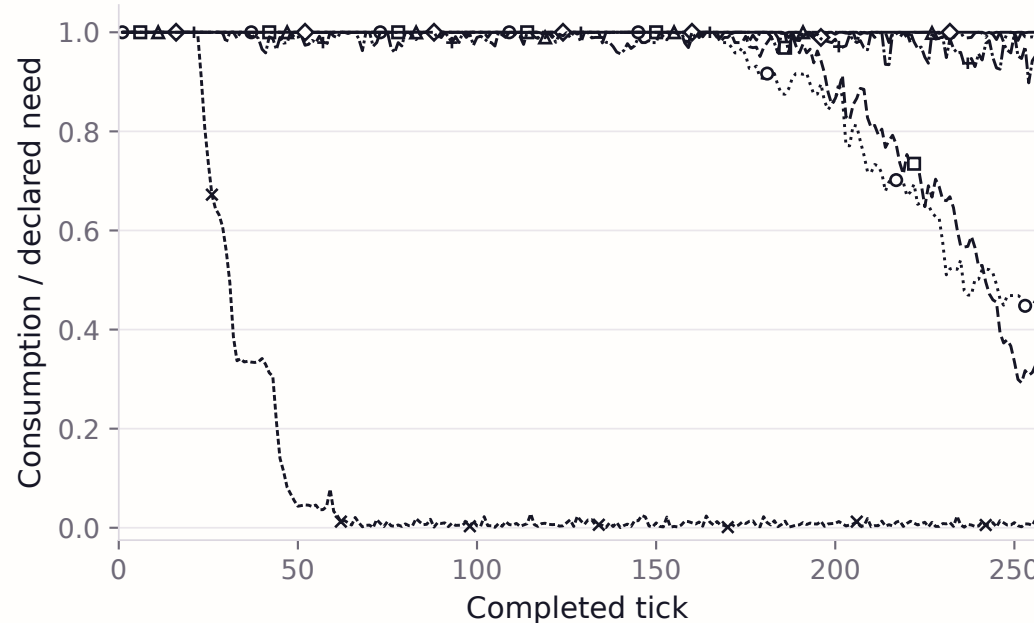

B Selected minus each paired baseline

Mean and observed min-max; not confidence intervals

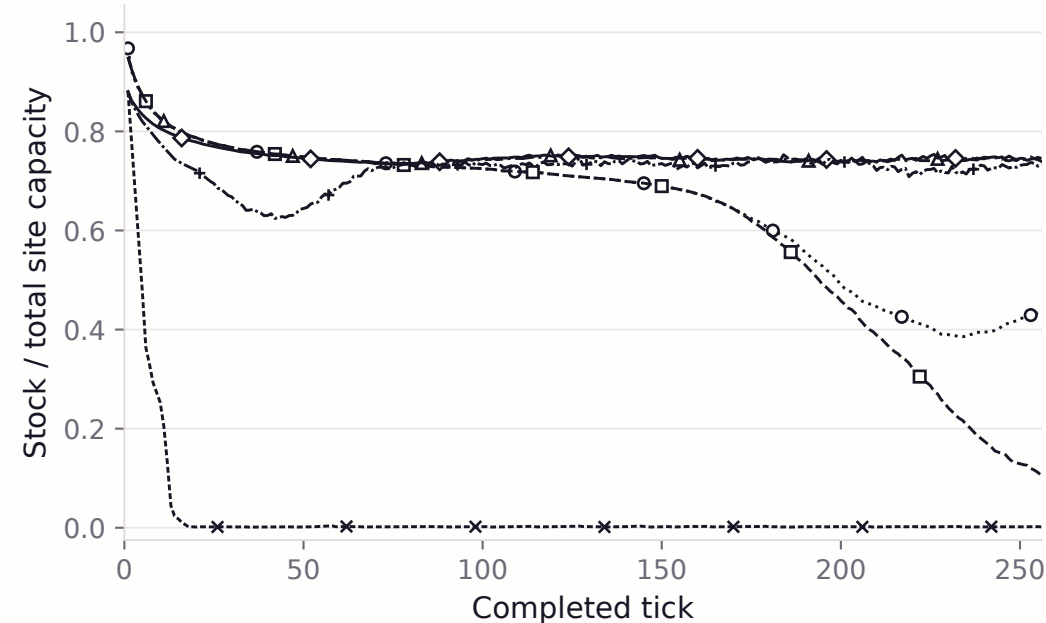

C Reference consumption trajectory

Reference r 0.24 · need 1.2; mean across four fresh seeds

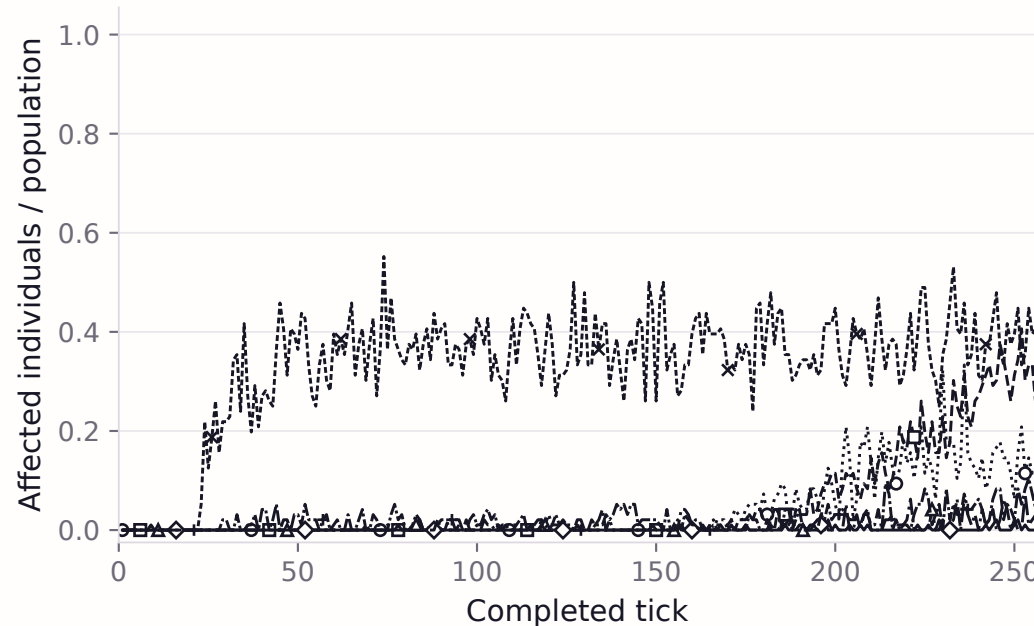

D Reference total ecological stock

Reference $r = 0.24$ · need 1.2; mean across four fresh seeds

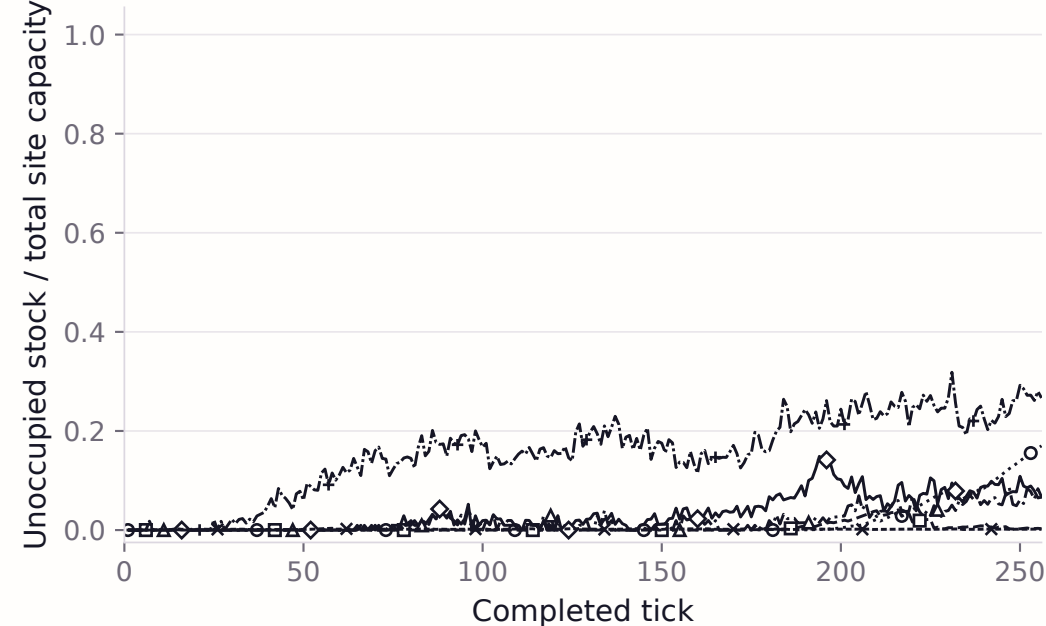

E Shortfall while ending off-site

Positive tick shortfall and ending away from a resource site

F Stock at unoccupied sites

Evaluator-only diagnostic; neither reachability nor sustainable yield

 Legacy need-2

  Selected candidate
  All aggressive

* Shaded reference row. Sensitivities retain reference settings except their named change. Reference curves are unsmoothed tick means.

336 evaluation episodes; repeated seeds across cells and conditions are dependent. Off-site shortfall and unoccupied stock are distinct diagnostics.

Fresh evaluation compares the frozen selection with anchors; it does not complete ecological/incentive qualification or establish institutional usefulness.
