

A simple baseline exposes an evaluation gap

Exploratory reconstruction · saved mechanism cases · drought outcomes

Focal consumption welfare

per member per tick · higher is better

Focal private utility

per member per tick · higher is better

Outward raid loss

per focal society per tick · lower is better

Other societies' welfare

mean of the two others · higher is better

Means over 108 focal scenarios: 12 environment/timing tuples × 3 opponent panels × 3 identities.

One existing evolved lineage; zero new searches. Means are not universal guarantees or uncertainty intervals.

Zero raid loss excludes patch competition. Welfare = $.85 - 1.5 \times \text{unmet need/member/tick}$; these are one outcome.

Axes use separate, displayed ranges. Focal private utility includes consumption plus $0.2 \times \text{terminal wealth}$.
