

The aggregate gain is uneven across societies

Coevolution — fixed institutions · drought cases · 36 matched cases per focal society · one run pair

Society 0 accounts for the net welfare advantage. Societies 1 and 2 have slightly lower welfare and greater outward harm.

Tax is compulsory pooling, separate from voluntary contribution. A lower tax transfer is not itself a welfare improvement.

Recorded population contrasts do not isolate the effects of individual institutional edits; targeted counterfactuals are still needed.
