

What changes when we swap members and institutions?

Frozen-program diagnostic · four matched conditions · drought outcomes

Each cell averages 108 focal cases: 12 environments × 3 opponent panels × 3 society identities.

Welfare = 0.85 – 1.5 × unmet consumption/member/tick. These two panels encode the same outcome.

One evolved lineage; post hoc diagnostic, not an independent search replication. Darker shading means a larger value within each panel.
