

Learning with private and pooled evidence

24 independent arenas · each arena contributes one mean across its interacting societies

Condition	Time-average CRPS	Difference vs private	Paired 95% arena interval	Final probe CRPS	Unique receipts per model
Frozen prior	0.9422	+0.6335	[+0.4518, +0.8517]	0.9422	0
Private observations	0.3088	Reference	—	0.2496	128
Pooled evidence reference	0.2703	-0.0384	[-0.0470, -0.0306]	0.2481	384

Negative differences favor that condition. Time-average CRPS is the trapezoidal area divided by the observed tick span.

All arms use the same fixed numerical learner. Pooled evidence receives more observations; sharing rules are not learned.

This control estimates parameters in supplied mechanisms. It does not test structure discovery, active experiments or evolved learning.
