

How much computation buys closer posterior agreement?

Measured CPU time for one dataset · pooled ecological histories · no model-generation calls or evolutionary search

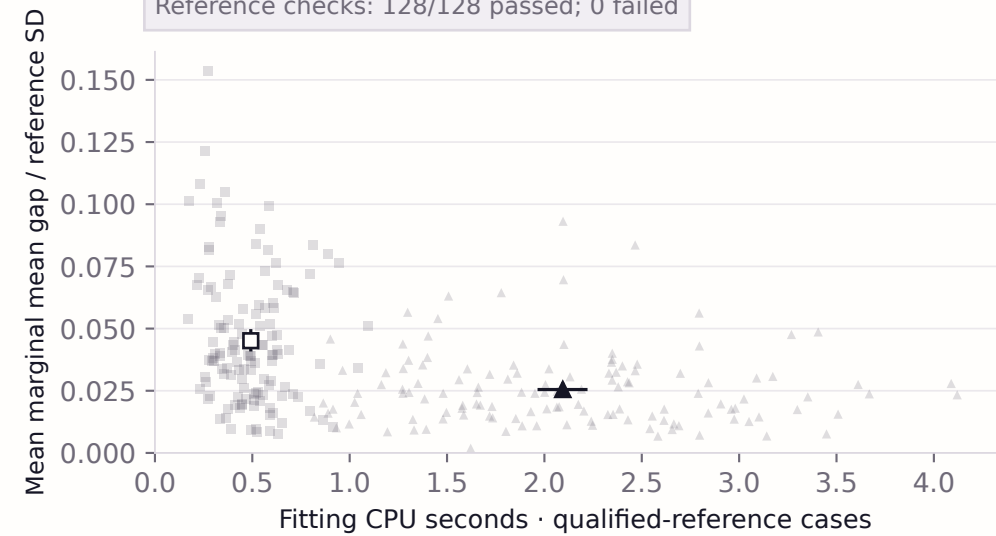

Prior-predictive control · n=128

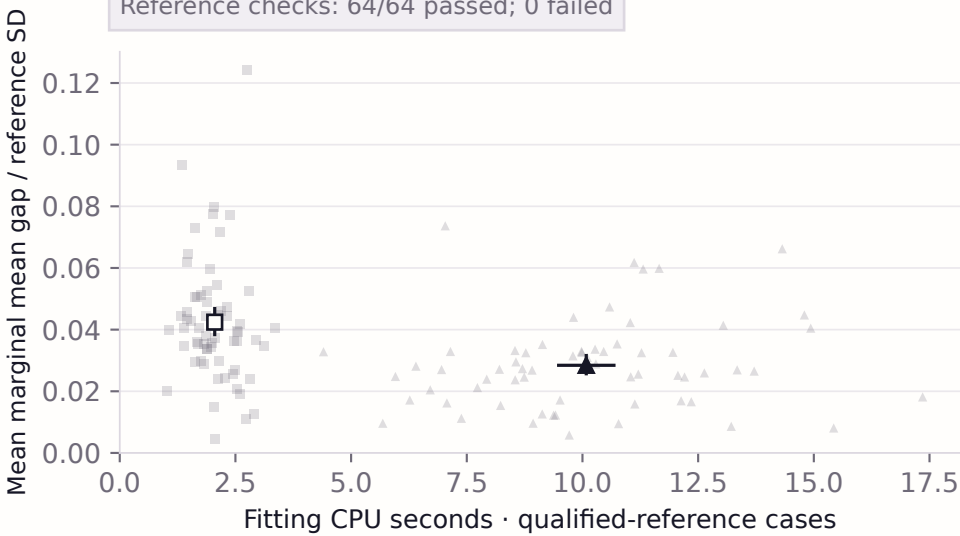

Ecological task panel · n=64

Reference checks: 128/128 passed; 0 failed

Reference checks: 64/64 passed; 0 failed

Top: all-case cost, including reference retries. Bottom: individual cases and means on the shared qualified-reference subset; each case averages r, b and g.

Timing depends on the machine. Batch references have numerical error; their agreement is a computation diagnostic, not an exact-truth guarantee.
