

How closely does each particle posterior match the reference?

Only cases whose independent batch reference passes declared checks · the same cases are paired across particle settings

Small linked marks: paired cases. Large markers and lines: means and 95% case bootstrap intervals. Lower gaps and width ratios near 1 indicate agreement.

Vertical ticks in mean panels: reference MCSE / posterior SD (mean across cases). Prior-predictive control 0.027; Ecological task panel 0.026.
